

Date: .....

Dear Doctor,

Your patient ..... has previously been given a penicillin and had / describes symptoms that would suggest an allergic reaction.

Please could you ensure that your records reflect the patient’s allergy status.

The National Patient Safety Agency (NPSA) *Safety in doses: improving the use of medicines in the NHS*<sup>1</sup> identified seven key actions to improve medication safety. One of these was a need to document patients’ medicine allergy status in both primary and secondary care. Improving the recording of patient allergies and raising awareness amongst staff of high risk products and the importance of knowing the patients’ allergy status were seen as key actions to reduce the small but significant risk of the morbidity and mortality associated with allergic reactions.

In response to the NPSA report, the South West Strategic Health Authority is working in partnership with the ABPI to enable Trusts (primary care and hospital) on a campaign to improve patient safety in relation to allergies to medicines.

As part of the Medicine Allergy Matters campaign you patient has been given a leaflet describing the difference between an allergy and a side effect and a card explaining that they have an allergy to penicillin (to be kept in their purse / wallet).

Yours Sincerely
